

LIVE BETTER WITH WOOD

Schönauer AG

Schönauer AG, based in the St. Gallen Rhine Valley, has been a competent partner for traditional and future-oriented building with wood for 29 years. Whether conversion, new construction or renovation, we offer architecture, construction and project management, timber construction, joinery and carpentry, everything from a single source. The trend towards more objects being processed as general contractor or total contractor corresponds to the goal of Schönauer AG. A total of 45 employees work enthusiastically on many creative projects at the Rebstein and Marbach locations and fulfill various customer requests with great commitment and a lot of expertise.

In the last year and a half, Schönauer AG was able to commission and move into a new, larger and more spacious hall. The office wing was created as the front end of the new hall. The 16-strong Schönauer AG crew was able to move into the office building in October 2022. All employees, from administration and architecture to the work planners and project managers, work in these new, modern offices. The new star is not just the hall, but the new CNC production machine.

TW Concept Line – the production line

Although the new hall was not officially inaugurated until spring 2023, the TW-Mill E was already used in May 2021, because a large construction order with 62 modules was waiting. Thanks to the TW-Mill E, it is possible to cover the entire Schönauer AG product range. The new machine offers partners and customers almost unlimited possibilities without incurring large additional costs. Thanks to the modular construction, a lot of work can be done in the factory and the proportion of construction work takes up a shorter time frame.

TechnoWood AG provided Schönauer AG with perfect advice right from the start and responded to all special needs. The TW Concept Line is modular and expandable and can therefore be designed very individually.

New workshop in Marbach

When work processes become more complex, the volume of orders constantly grows and production reaches its limits, the desire arises for a spacious hall in which the quality that Schönauser AG is known for can be delivered using state-of-the-art machines.

It goes without saying that the new hall should also be a reference in terms of timber construction. The numbers are correspondingly impressive: The 3,500 m² production area stands on an incredible 1,103 piles with a total length of 13,260 km of wood, all sourced from the Rhine Valley. 760 m³ of wood was used for the supporting structure alone. Added to this were 3960 m² of elements. For Schönauser AG, wood is the decathlete among building materials. If you understand wood, there seem to be no limits. With the new workshop and the TechnoWood TW-Mill E in the centre, Schönauser AG is the first point of contact for architecture, timber construction and carpentry work..

The 9 apprentices are trained in the joinery, architecture or carpentry department and gain insight into many disciplines relating to conversion, new construction, project work on single-family houses, hall structures, but above all in element construction.
